

Smart Data enhances decision making across your organization.

System Requirements and Application Versions

For maximum user speed and workability VDAX recommends using a data driven computer. However, any System will be able to connect to VDAX. (VDAX is not limited to a specific operating system – i.e. Mac OS X, Microsoft Windows, Linux, etc.).

In its native form, VDAX runs as an Analysis Services database. Analysis Services is a new form of database; thus, some applications will not have the ability to connect. The application requirements to connect to an Analysis Services database are written below.

The recommended applications and versions are:

1. 1.8 Microsoft Office 2013 – Excel (or a more recent version).
2. PowerBI (in its most recent version).
3. Tableau (in its most recent version).
4. Any analysis tool or application that can connect to Microsoft Analysis Services or SQL Server Analysis Services databases.

Please Note: As VDAX continues to develop it will be made available in additional formats. Users will also be able to request a specific format that best suites their application (csv, .cub, views, postgre SQL database, etc.).
